Drug driving

• Drug driving is a serious road safety issue in Australia, with over 9% of road fatalities involving a driver or motorcycle rider who had an illegal drug in their system.<sup>1</sup>

• Drug use increases the risk of crash involvement, with drivers having illicit drugs in their system being 10 times more likely to be responsible for causing a crash.<sup>2</sup>

State of the Road A Fact Sheet of the Centre for Accident Research & Road Safety - Queensland (CARRS-Q)

THE FACTS

• Research demonstrates that an alarming number of motorists are driving after consuming illegal drugs and the occurrence of drug driving in some groups may be greater than drink driving.<sup>3</sup>

• Rates of self-reported drug driving have decreased in Australia, from 21% in 2007 to 15.1% in 2016.<sup>4</sup>

• In Queensland in 2018/19, almost 70,000 roadside drug tests were undertaken with approximately one in five drivers (20%) testing positive.<sup>5</sup>

How do drugs affect the body?

• Many drugs can affect an individual’s ability to drive safely, including illegal (illicit) drugs, as well as legal drugs such as alcohol and medications (prescribed and over-the-counter).

• Drugs that affect driving include cannabis (marijuana), amphetamines, benzodiazepines, hallucinogens, antihistamines and opiates.

• In 2019, the most commonly used illegal drugs were cannabis (11.6%), followed by cocaine (4.2%), ecstasy (3.0%), the misuse of pain-killers/opioids (2.8%), and the misuse of tranquillisers/sleeping pills (1.8%).<sup>6</sup>

• The self-reported use of meth/amphetamines has been declining, from a high of 3.4% in 2001 to just 1.3% in 2019.<sup>7</sup>

• Many drugs are highly addictive to the extent that users need them in order to function in their daily routine.

• Excessive drug use can cause cognitive impairment, which can affect judgement, memory and reaction time.

• If an individual consumes drugs in the evening they can still have drugs present in their system the next day.

• The level of drugs which will remain in a person’s system over time depends on a range of factors including the quality and quantity of the drug, if it was taken in combination with other drugs/alcohol, and the individual’s metabolism.

• Drug use worsens your driving through cognitive impairment, which affects your judgement, memory and reaction time.

• Drug use affects the driving task in different ways, depending on the drug taken and other factors, resulting in effects including:<sup>8</sup>
  - Slowing down reaction times and reducing coordination – reducing the ability to perform in an emergency.
  - Reducing the ability to multi-task – an essential skill for safe driving.
  - Causing a distorted view of time and distance – reducing the ability to drive safely and identify driving hazards.
  - Reducing your attention span, increasing the risk of not noticing other road users.
  - Increasing over-confidence in driving skills that are not supported by actual driving ability.
  - Causing hyperactivity, unstable moods, and aggressive or dangerous driving.
  - Causing convulsions, dizziness, fainting, muscle weakness or unconsciousness.
  - The sudden onset of fatigue as the stimulant effects wear off.
  - Causing hallucinations and paranoia.
  - Resulting in an altered view and experience of reality, whereby actions and responses are quite different to what is actually required.

Can I have a small quantity of drugs and still drive?

• The best and safest approach is to never drive after taking any amount of illegal drugs, or prescribed or over-the-counter medications that could affect your driving.

• Speak to your doctor or pharmacist about the potential effect a medication may have on your driving and be aware of the dangers of mixing medications and consuming alcohol.

• Severe penalties apply to anyone caught driving under the influence of illegal drugs. However, if you are going to use drugs, the safest approach is to plan ahead and adopt an alternative transportation plan, such as:
  - Organising a driver who will not be using any drugs or drinking alcohol.
  - Using public transport, catching a cab or using a rideshare service.
  - Walking – but make sure to walk in a group or with a sober friend, and remember to stay on the footpath and only cross at marked crossings or where you are clearly visible to motorists.

Penalties for drug drivers

• Drug driving legislation is in effect in all Australian jurisdictions. Consequences of drug driving include not only a fine and loss of licence, but also the potential loss of insurance.

• In recent years, roadside drug testing has
increased, using saliva samples to detect a range of illicit drugs, including:

- THC (the active component in cannabis).
- Methamphetamine (found in drugs such as speed, ice and crystal meth).
- MDMA (commonly known as ecstasy).

In Queensland, there is zero tolerance for driving under the influence of illegal drugs, meaning you can be penalised if any trace of drugs is found in your system.

A drug driving offence in Queensland may carry a maximum penalty of up to AUD$3,736 (AUD$8,007 for a repeat offence), licence disqualification for up to nine months (up to 2 years for a repeat offence) or a term of imprisonment for up to nine months.

Prosecutions can be commenced as a result of breaches of the Workplace Health and Safety Act for any worker under the influence of drugs who has been found negligent in his/her duties. Management, supervisors or fellow workers could also be legally liable if they were aware of a worker’s drug driving and failed to respond to the situation (send the driver home and/ or suspend his/her driving tasks).

CARRS-Q WORK IN THE AREA

- Review of drug driving in Queensland, by exploring QPS roadside drug testing data and crash data and performing a data scoping exercise with other jurisdictions.
- Longitudinal evaluation of the Queensland roadside drug testing program, drug prevalence rates and characteristics of detected drivers.
- Profile of drug-involved fatal crashes and characteristics of the persons involved.
